PRESS RELEASE – FOR IMMEDIATE DISTRIBUTION

Shomax Energy US Inc. Obtains Results from Winter Wheat Testing Trial

Wichita Falls, TX – June 11th, 2025 - Shomax Energy US Inc. (“Shomax”) is pleased to announce that it has completed its winter wheat trial in Electra, Texas yielding both higher bushels per acre and higher product volume using its revolutionary new green ammonia product. With the cooperation of a prominent local farmer, Shomax was able to spray 40 acres of winter wheat earlier this year using its product which is 100% Made in America. Utilizing 20% less product, Shomax yielded a consistent 5% increase across the field, with some areas showing as much as 48% increase versus the UAN deployment. In addition, the Shomax wheat measured a 3% higher weight per bushel proving the quality of the fertilization regimen. When accounting for retail pricing of UAN, the overall savings to the farmer would be 48.6% on nitrogen-based inputs, or approximately \$40 per acre depending on current pricing and nitrogen rate.

“The spring weather certainly didn’t help our trial as we moved from drought to extreme rain and hailstorms which left a lot of damage on the field, but we were able to harvest plenty of wheat for testing comparisons. Utilizing Texas A&M extension services along the way to measure the plant progress as nitrogen uptake was occurring, we were able to see how well the product works in the real world”, commented Tom Bowker, Shomax’s Chief Strategy Officer.

Adding to the advantages, Mr. James Brockriede, who owns the farm, noted that he had “no problem deploying the Shomax product on the crop” and that “it was applied the same way as the UAN product I regularly use.” Shomax has designed its fertilizer to be distributed and sold to farmers in the same way it’s always been done to ensure that it could be easily integrated using equipment farmers are used to using year after year.

Shomax’s pilot production facility is set to break ground in Wichita Falls, Texas, later this year, and will produce approximately 220,000 tons of products for sale annually in the local region. Utilizing off-grid solar capability, the facility can produce fertilizer at a fixed price point, providing stability for farmers and decrease their overall costs. In addition, the facility will run in a carbon negative position, removing more carbon from the air than it will emit, taking scope 1, 2 and 3 emissions into account. This is critical for farmers as it can help them to compete in sustainable food markets which require controls on their upstream emissions to meet net zero targets.

About Shomax Energy US Inc – Shomax Energy US Inc is a Texas-based, independent developer and operator of green fertilizer manufacturing facilities. The company is focused on creating the most advanced green fertilizers in the world that provide farmers with predictably better outcomes.
